Long table row

This single text-only row is taller than a page. It continues at safe line boundaries, with the column header repeated on each page.

Review notes	Reference
Checkpoint 01: source records were compared with the submitted request; discrepancies, reviewers, and follow-up actions were logged. Checkpoint 02: dates and identifiers were checked against the original evidence; unresolved differences were assigned for review. Checkpoint 03: supporting documents were checked for completeness, consistent naming, and clear links to the requested outcome. Checkpoint 04: the reviewer recorded each source, the relevant section, the decision made, and any remaining question. Checkpoint 05: approval notes were compared with the current policy; exceptions were described with their supporting evidence. Checkpoint 06: totals were recalculated from the underlying entries, and any adjustment was traced to its source record. Checkpoint 07: the review log was updated so another team member can reproduce the checks without relying on informal notes. Checkpoint 08: records with incomplete details were separated from verified items and given a named follow-up owner. Checkpoint 09: the latest document version was confirmed, and superseded copies were identified to prevent conflicting decisions. Checkpoint 10: each conclusion was matched to an observed fact, with assumptions clearly marked for a second reviewer. Checkpoint 11: the requested dates were checked for gaps and overlaps, and the affected period was noted in the review log. Checkpoint 12: names and account references were compared across the request, attachments, and source records. Checkpoint 13: supporting calculations were retained with enough context to explain inputs, rounding, and any manual changes. Checkpoint 14: items requiring approval were routed to the correct owner, with the reason and due date recorded. Checkpoint 15: the reviewer checked that each attachment was readable and that its contents matched the reference in the request. Checkpoint 16: differences between submitted values and source values were listed individually rather than combined into one note. Checkpoint 17: the evidence trail was checked for missing pages, duplicate records, and references that could not be resolved. Checkpoint 18: the decision summary was reviewed for clear wording, accurate amounts, and consistency with the documented evidence. Checkpoint 19: follow-up responses were linked to the original question so the full reasoning remains visible in one place. Checkpoint 20: changes made during review were recorded with their author, date, and explanation for future verification. Checkpoint 21: the final figures were compared with the	CASE-2026-041

Review notes	Reference
approved source, and the calculation was independently repeated. Checkpoint 22: pending items were kept separate from completed checks so the report does not imply premature approval. Checkpoint 23: the reviewer confirmed that every required field had a source and that blank values were intentional. Checkpoint 24: references were checked for consistent formats and corrected where an identifier could point to multiple records. Checkpoint 25: the summary was reconciled with the detailed notes, including the status and owner of each exception. Checkpoint 26: evidence that did not affect the decision was retained but clearly distinguished from the controlling records. Checkpoint 27: the review was checked for duplicate effort, contradictory comments, and follow-ups that had already been resolved. Checkpoint 28: the supporting file list was compared with the request so missing or unexpected documents could be explained. Checkpoint 29: the reviewer documented the limits of the available evidence and avoided conclusions beyond what it supports. Checkpoint 30: a second reviewer checked the key references, calculations, and final disposition before the record was closed.
