All New Features — Combined Demo

This document showcases all **six new features** in one report: hyperlinks, rich text, watermark, multi-column, gantt chart, and streaming.

1. Hyperlinks & Internal Links

External: visit the project repository.
Internal: jump to the Gantt section or back to the top.
Links are fully clickable in any PDF viewer and use doc.link() / doc.goTo() internally.

2. Rich Inline Text

Combine **bold**, *italic*, underline, highlight, red, large purple, and ~~strikethrough~~ in one paragraph. Nest them: **bold with *italic* inside**.

3. Watermark

Notice the diagonal **SAMPLE** watermark behind every page — specified by <meta name="watermark" content="SAMPLE"> in the head. It renders at 12% opacity, rotated -30°, in the background layer before all content.

4. Multi-Column Layout

The engine can distribute child blocks across N equal-width columns using column-count CSS or data-columns attributes.
Content flows into the first column until it reaches the target height (total / count), then spills into the next column.
Vertical rules between columns are optional — set via data-column-rule.
The entire multi-column block is kept atomic: it never splits across pages, ensuring visual consistency.

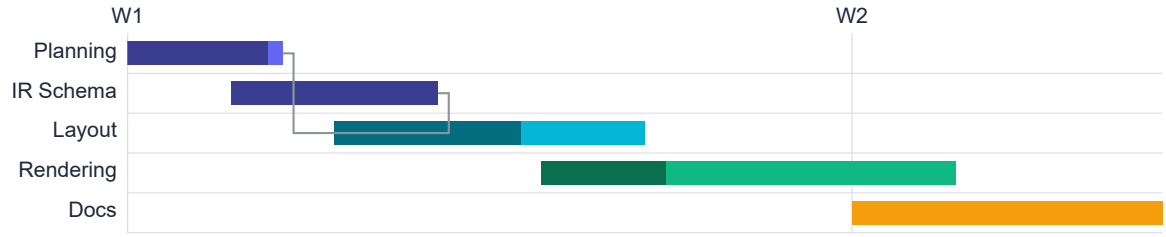

Three columns with a light rule between each boundary, ideal for comparison layouts or newsletter-style content.

Each column receives equal width calculated from the available space minus inter-column gaps.

This sample uses the data-columns attribute form rather than inline CSS column-count.

5. Gantt / Timeline Chart

Feature Development Timeline

6. Streaming Output

The renderToStream() API returns a ReadableStream<Uint8Array> that flushes each page incrementally (with bufferPages: false), reducing peak memory for server-side rendering:

API	Output	Use case
renderToBuffer()	Complete Buffer	One-shot generation
renderToStream()	ReadableStream	HTTP response streaming
createReport()	Live PDFDocument	Manual pipe / custom write

All six features are declarative: watermark via <meta>, links via <a>, rich text via inline elements, columns via CSS column-count, gantt via data-chart="gantt", streaming via the renderToStream() API.
