Multi-Column Layout

The following sections demonstrate 2-column and 3-column layouts using column-count CSS and the data-columns attribute.

Two Columns (CSS column-count)

Column Flow

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris.

Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident.

Balanced Distribution

Content flows from the first column to the second, filling each to approximately equal height. The engine distributes fragments by target height (total / column count).

Sed ut perspiciatis unde omnis iste natus error sit voluptatem accusantium doloremque laudantium, totam rem aperiam.

Three Columns (data-columns attribute)

First column content with a vertical rule between columns. The data-column-rule attribute adds a thin line at each column boundary.

Second column continues the flow. Multi-column blocks are kept atomic — they never split across pages.

Third column finishes the distribution. Each column gets equal width: (available - gaps) / count.

Additional Content

When more paragraphs exist than columns, they distribute by height. The target is total_height / N columns.

This makes newsletters, multi-column reports, and side-by-side comparisons easy to lay out.

Nemo enim ipsam voluptatem quia voluptas sit aspernatur aut odit aut fugit.

Two Columns Without Rule

Left Side

At vero eos et accusamus et iusto odio dignissimos ducimus qui blanditiis praesentium voluptatum deleniti atque corrupti quos dolores.

On the other hand, we denounce with righteous indignation and dislike men who are beguiled.

Right Side

These cases are perfectly simple and easy to distinguish in a free hour when our power of choice is untrammelled.

When nothing prevents our doing what we like best, every pleasure is to be selected and every pain rejected.
